Goals

- Become a producer
- Stay with friends
- Be able to enjoy nights under the starry sky

Motivation

- Family
- Friends
- Listening to music

Frustration

- Perfection
- Order

Introvert

Extrovert

Messy

Organized

Analytical

Creative

About

 19 years old

 producer

 Reutlingen, Germany

 Music, Friends, Bike

Apps

Sceanrio

Maarten is still very quiet in the morning, also a so-called morning person, so he first puts on some quieter but also cheerful music in the morning to be able to start the day well. So he opens the App and uses the **BPMode** to select his **MORNING MODE**, where he selected a playlist with happy music. Due to the automatic increasing Bpm of the successive songs, his pulse increases and he becomes more awake from time to time and can now go to college. In the afternoon there is sports and for motivation there is intense hard- and metalcore music to bring the performance to its maximum, so it is now time to by specific Bpm regulation it is possible to warm up and cool down the body perfectly over the training process, so he starts the **TRAINING MODE**, with the added hard- and metalcore playlist. To learn something in the afternoon, melodic music is turned on to not be distracted by the lyrics, trance music provides the perfect focus and the certain motivation, so he uses his **LEARNING MODE**, where he setted the bpm to a lower bpm to not get overstressed at learning and with his chill trance music playlist he is now able to learn without problems. When he goes out in the evening, the bpm is turned up again to get everything out of him. It is now time for **PARTY MODE**. With the automaitc regulation of the bpm, he is able to control the crowd perfectly, he starts with lower bpm and when the crowd catches up with the beat he has full control of them and the bpm starts to rise. Later in the evening he goes into the reflective phase and has to lower the pulse again so its time for **RELAX/SLEEPING MODE**, with house and future music he wallows in nostalgia and is ready to go into the dreams.

Navigation Design

Hub and Spoke

Hub and Spoke has one Hub and many „Spokes“, so when you want to switch between different Spokes, or subpages, you first have to go back to the hub.

Fully connected

The main pages are connected to each other and from any page you are able to reach any other of the main pages, this design pattern is the most common among OS devices and therefore a good choice, as it directly represents a familiar navigation environment for many users and also directly presents a simple navigation structure for other users. It is a faster way to get from one subpage to another, comparing it to hub and spoke, it is more likely to get used in an app like this. You do not have to lose time by searching for the specific target, which may be a reason for some user to just close the app.
